

## ABSTRACT

A container, particularly a support for plants, comprising at least two coaxial annular elements joined together by arms articulated on these elements such that said elements are  
displaceable coaxially in relation to one another between a folded-flat position in which they are  
in the vicinity of one another and an unfolded position in which they are moved away from one  
another at the same time as said arms change orientation. Said arms (10) and said annular  
elements (104) comprise reciprocal bearing means comprising projecting fingers (113, 114, 115,  
116).
